NAME

curl_multi_cleanup - close down a multi session

SYNOPSIS

#include <curl/curl.h>

CURLMcode curl_multi_cleanup(CURLM *multi_handle);

DESCRIPTION

Cleans up and removes a whole multi stack. It does not free or touch any individual easy handles in any way - they still need to be closed individually, using the usual $curl_easy_cleanup(3)$ way. The order of cleaning up should be:

- 1 curl_multi_remove_handle(3) before any easy handles are cleaned up
- 2 *curl_easy_cleanup(3)* can now be called independently since the easy handle is no longer connected to the multi handle
- 3 *curl_multi_cleanup*(3) should be called when all easy handles are removed

RETURN VALUE

CURLMcode type, general libcurl multi interface error code. On success, CURLM_OK is returned.
